

Synthesis

Aboriginal Peoples and Forest Certification: a Review of the Canadian Situation

*Anna V. Tikina*¹, *John L. Innes*¹, *Ronald L. Trosper*¹, and *Bruce C. Larson*¹

ABSTRACT. We assess how different certification standards address Aboriginal issues in Canada, augmenting current legislation related to Aboriginal issues. The benefits from forest certification and the obstacles to its adoption by the Aboriginal community are also reviewed. We conclude that it would take significant effort, time, and resources to achieve widespread Aboriginal adoption of forest certification.

Key Words: *First Nations; Aboriginal forestry; Aboriginal peoples; Canada; forest certification*

INTRODUCTION

Certification of forest management has become a global phenomenon that is rapidly becoming accepted as a part of “doing business.” Initially designed to combat deforestation and forest degradation in developing countries, forest-certification uptake in this area has been very slow, and the extent of certified forest in the tropics remains negligible (International Tropical Timber Organization 2005). In contrast, uptake in developed countries has been extensive, with Canada leading the world in the total area of certified forest and in the proportion of its managed forest that has been certified. Most of this certification has been for large industrial companies, and uptake by small-scale private operations and by communities has been much more limited. Three major performance-based certification systems are usually included in any discussion of sustainable forest management (SFM) certification in Canada. They are the multiple regional Forest Stewardship Council (FSC) standards, the Canadian Standards Association (CSA) Z809 standard, and the Sustainable Forestry Initiative standard (SFI).

At its conception in the mid-1990s, one of the major aims of the forest certification process has been to improve the lives of Aboriginal communities that depend on the forest (see, for example, the [FSC Principles and Criteria](#)). Few certification standards explicitly focus on communal or Aboriginal forest companies, but in regions where such management

is becoming more common, this option is sometimes included in the relevant standard (e.g., the draft of the 2008 [FSC Australia National Standard](#), Indicators 3.1.1.–3.1.4.). Although most articles and reports on SFM mention the role that forest certification could play in moving a management operation towards sustainability, less attention has been given to the benefits that certification has brought to Aboriginal communities. We analyze the current state of knowledge on the relationship between certification and the livelihoods of Aboriginal peoples in Canada, and provides the background for a more detailed study of Aboriginal perspectives on forest certification. We discuss both ways in which forest certification is applicable to Aboriginal communities: (1) certification of Aboriginal forestry, and (2) certification of forest companies working in Aboriginal traditional territories. For our purposes, “traditional territory” is defined as the “land occupied and used historically” by an Aboriginal group, that is “integral to their identity and survival as a distinct nation” (British Columbia Treaty Commission 2009a).

METHODS

Our objective was to collect the evidence about the effects of forest certification on Aboriginal livelihoods, and also about the perceptions of Aboriginal peoples on forest certification in Canada. The review methodology included a

¹Faculty of Forestry, University of British Columbia

keyword search (keywords used: forest certification, Aboriginal people, First Nations, criteria and indicators, Aboriginal forestry, and social issues and impacts), and a search of authors who have written on the topic of Aboriginal forestry or legal aspects of resource management in Canada. Expert advice was also used to identify primary references on the topic and the names of researchers working in the area. The sources were peer-reviewed publications including books or articles published in scientific journals, and “gray” literature, including on-line reports or popular articles that have not been reviewed by independent peers. The references in the found sources were checked for related information, and “related article” searches were also included in the data collection. Overall, more than 100 sources were identified. The search was limited to publications in English.

During the search, the research questions were refined to reflect the applicability of specific standards and legal requirements, and Aboriginal sources in favor or critical of forest certification. The collected information was evaluated based on its relevance to the topic (Cooper 1998). For example, the list of the court cases was limited to cases dealing with resource management. Once the relevant sources were identified, the available information was analyzed using the review questions described above.

HOW THE STANDARDS ADDRESS ABORIGINAL ISSUES

Smith (1998) calls for the recognition of Aboriginal rights and title as an aspect of SFM. Forest certification standards differ on how they address Aboriginal peoples’ rights and issues. As all standards under review require compliance with applicable laws and regulations, a brief review of the main regulatory milestones pertaining to Aboriginal issues follows. We include an analysis of how each of the forest certification systems approach Aboriginal issues.

Applicable Laws and Regulations

Three levels of legislation are applicable in Canada: international agreements ratified by the country, federal legislation, and documents adopted at the provincial or territorial level. Whereas the first two

sets of documents regulate activities across the country, provincial laws and regulations differ in their approaches to Aboriginal issues (Tolleson et al. 2008). Although earlier provincial documents seem to undermine the inclusion of Aboriginal cultural values into forest management, more recent developments show that almost all provinces and territories provide for inclusion of cultural information into forest management planning (Elias 2004). The duty to consult with Aboriginal groups has been reflected in a greater number of legal and regulatory sources, and provinces or territories make steps of varying effectiveness toward interweaving Aboriginal values in forest management (Elias 2004, McGregor 2009). As Canadian law is also based on precedent, court decisions, and especially those of the Supreme Court of Canada, constitute a significant source of regulation.

Canada has not signed the UN Declaration on the Rights of Indigenous Peoples (United Nations 2007), but has ratified some of the applicable human-rights international conventions (Table 1). The Canadian definition of Aboriginal rights and title includes the following statement: “Aboriginal rights refer to practices, traditions and customs that distinguish the unique culture of each First Nation and were practised prior to European contact. Aboriginal title is an Aboriginal property right to land.” (British Columbia Treaty Commission 2008).

Canadian law dealing with Aboriginal peoples is evolving rapidly, and the interpretation of that law is constantly changing with the case law introduced by court decisions. For example, the [Gitanyow](#) decision of the British Columbia Supreme Court (Canadian Legal Information Institute 2004c) rules for “deep consultation” from the side of the Crown and reconciliation of pre-existing forest licenses can be disputed, as the Crown has already issued a notice to appeal the Gitanyow decision (O’Callaghan et al. 2008). Its outcome may change with the decision of higher courts (the British Columbia Court of Appeal and, as an ultimate possibility, the Supreme Court of Canada).

Forest Stewardship Council

The four regional FSC standards in Canada (British Columbia, Boreal, Maritime, and a draft Great Lakes–St. Lawrence standard) all provide specific

Table 1. Major documents related to Canadian Aboriginal law.

International Agreements ratified by Canada	
International Convention on the Elimination of All Forms of Racial Discrimination 1970 (Office of the United Nations High Commissioner for Human Rights 1969)	The Convention requires all signatory states to “take effective measures to review governmental, national and local policies, and to amend, rescind or nullify any laws and regulations which have the effect of creating or perpetuating racial discrimination wherever it exists.” In the view of many First Nations, the policy that Aboriginal title needs to be proved violates the requirements of this convention (First Nations Leadership Council 2007). Examples of cases dealing with racial discrimination of Aboriginal peoples include <i>McKinnon v. Ontario</i> 2004 (Hadibhai 2004) and <i>Frank v. A. J.R. Enterprises Ltd.</i> 1993 (Ontario Human Rights Commission 2001).
International Covenant on Civil and Political Rights 1976 Office of the United Nations High Commissioner for Human Rights 1976a); International Covenant on Economic, Social and Cultural Rights 1976 (Office of the United Nations High Commissioner for Human Rights 1976b)	Article 1 of the Covenants demands self-determination of all peoples, which applies to the determination of the political and institutional status and the pursuit of economic, social, and cultural development. Although official Canadian reports to the United Nations do not include discussion of Article 1 (Government of Canada 2004), First Nations have focused on the need to establish Aboriginal governments and to develop an independent legal system to regulate land, resources, and culture, which falls under the notion of Article 1.
UN Convention on Biological Diversity 1992 (Secretariat of the Convention on Biological Diversity 1993)	Article 8(j) requires respecting, preserving, and maintaining “knowledge, innovations, and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity.” The Article further demands “approval and involvement of the holders of such knowledge, innovations and practices” and suggests fair sharing of the benefits arising from the utilization of such knowledge.
Federal Legislation	
Royal Proclamation 1763 (Virtual Law Office 1998)	Treaties between the British Crown and Aboriginal peoples are a method of extinguishing Aboriginal title to the land. The Crown has fiduciary duty for the land under the treaty.
Constitution Act 1867 (Canadian Legal Information Institute 1867)	Canadian Confederation deals with, and has obligation to legislate on, matters of Aboriginal peoples and “land reserved for Indians.”
Constitution Act 1982, Section 35 (Canadian Legal Information Institute 1982)	The section recognized and affirms existing Aboriginal and treaty rights. The Section applies to all Aboriginal people, including Metis, as was upheld in <i>Powley</i> , SCC 2003 (Canadian Legal Information Institute 2003).
Indian Act 1985 (Canadian Legal Information Institute 1985)	Provides rules on Indian status and management of reserve lands. Although the Act presents some provisions for local governance and communal collection of monies, it has so far failed to address the issue of self-government.
Court Cases	
<i>Jim</i> 1915 26 C.C.C. 236 (Resources for Aboriginal Studies 2006)	Hunting and fishing on reserves are regulated by federal, rather than provincial, legislation.
<i>Calder</i> [1973] S.C.R. 313, [1973] 4 W.W.R. (Canadian Legal Information Institute 1973)	The Supreme Court held that Aboriginal title exists as a concept of common law. It is based on the “long-time occupation, possession and use” of traditional territories.
<i>Kruger and Manuel</i> [1978] 1 S.C.R. 104. (Canadian Legal Information Institute 1978)	Provincial Wildlife Act is applicable to Aboriginals hunting outside the reserve by referential incorporation under s. 88 of the Indian Act.
<i>Haines</i> [1981] 495 BCCA (Canadian Legal Information Institute 1981)	The right to hunt is not extinguished. Hunting can happen at times outside the designated seasons.
<i>Guerin</i> [1984] 2 S.C.R. 335 (Canadian Legal Information Institute 1984)	Confirmed “fiduciary responsibility” of the Crown for Aboriginal peoples, and recognized pre-existing aboriginal rights on-reserve and off-reserve.

(con'd)

<i>Dick v. the Queen</i> [1985] 2 S.C.R. 309 (Canadian Legal Information Institute 1985)	The Supreme Court of Canada upheld the decision in <i>Kruger</i> 1976 that the Provincial Wildlife Act is applicable to Aboriginals, and that they need hunting permits, as required by the Act.
<i>Sparrow</i> [1990] 1 S.C.R. 1075 (Canadian Legal Information Institute 1990)	Traditional activities can be performed in a modern manner. The Crown is responsible for proving that the infringement on those rights serve a “valid legislative objective.”
<i>Van der Peet</i> [1996] 2 S.C.R. 507 (Canadian Legal Information Institute 1996)	Used as a test as to whether the identified right constitutes an essential, integral part of Aboriginal identity.
<i>Delgamuukw</i> [1997] 3 S.C.R. 1010 (Canadian Legal Information Institute 1997)	The case distinguished between Aboriginal rights and title. Title represents a connection between the First Nation and the land. Aboriginal rights and title can be proved, and the proof can include oral sources. Infringement of Aboriginal rights can be compensated.
<i>Halfway River First Nation</i> 1999 BCCA 470 (Canadian Legal Information Institute 1999)	The Aboriginal side also has a duty to consult, and it is prohibited to impose unreasonable conditions or refuse to consult.
<i>Kitkatla Band</i> 2002 SCC 31, [2002] 2 S.C.R. 146 (Canadian Legal Information Institute 2002)	The Supreme Court of Canada decided that Provinces can legislate acts of destruction of heritage sites, if the acts do not affect the “core of Indianness.”
<i>Haida</i> 2004 SCC 73, [2004] 3 S.C.R. 511 (Canadian Legal Information Institute 2004a) and <i>Taku</i> 2004 SCC 74, [2004] 3 S.C.R. 550 (Canadian Legal Information Institute 2004b)	These cases oblige the Crown to consult and possibly accommodate Aboriginal interests even where title has not been proven. Third parties are exempt from the duty to consult, but may be delegated some “procedural” aspects. Other cases that followed the <i>Haida</i> 2004 decision include: <i>Gitanyow</i> BCSC 2004 (Canadian Legal Information Institute 2004c), <i>Tzeachten</i> FC 2008 (Canadian Legal Information Institute 2008a), <i>Klahoose</i> BCSC 2008 (Canadian Legal Information Institute 2008b), <i>Carrier Sekani Tribal Council</i> BCCA 2009 (Canadian Legal Information Institute 2009a), and <i>Kwikwetlem First Nation</i> BCCA 2009 (Canadian Legal Information Institute 2009b).
<i>Marshall and Bernard</i> 2005 SCC 43, [2005] 2 S.C.R. 220 (Canadian Legal Information Institute 2005a)	This case sets limits to Aboriginal title: title requires evidence of exclusive and regular use of land for traditional activities. New activities are not protected by treaties. Claims of Aboriginal title are specific to the Aboriginal group and their relationship with the land.
<i>Mikisew Cree Nation</i> 2005 SCC 69, [2005] 3 S.C.R. 388 (Canadian Legal Information Institute 2005b)	Existing treaty rights are included in the Crown obligation to consult and accommodate Aboriginal interests.
<i>Huu-ay-aht</i> 2005 BCSC 697 (Canadian Legal Information Institute 2005c)	The Supreme Court of Canada ordered the Province to consult in good faith, which does not allow for a decision made by a population-based approach. The approach based on the Nation's population used in the Forest and Range Agreements failed to account for the individual nature of the claim.
<i>Morris</i> 2006 SCC 59, [2006] 2 S.C.R. 915 (Canadian Legal Information Institute 2006a)	The Supreme Court of Canada decided that the Provincial Wildlife Act cannot preclude the traditional way of hunting that constitutes a treaty right.
<i>Gray and Sappier</i> 2006 SCC 54, [2006] 2 S.C.R. 686 (Canadian Legal Information Institute 2006b)	The Supreme Court of Canada held that Aboriginal people can harvest timber on the traditional territory for domestic purposes.
<i>Dene Tha'</i> 2006 FC 1354 (Canadian Legal Information Institute 2006c)	The Federal Court of Appeal held that the Crown has a duty to consult with First Nations when establishing environmental and regulatory review processes. The duty to consult arises when the Crown possesses constructive and actual knowledge of an Aboriginal or treaty right that might be adversely affected by a planned activity.
<i>Tsilhqot'in First Nation</i> (“ <i>Xeni</i> ”) 2007 BCSC 1700 (British Columbia Courts 2007)	This case demonstrated the type and degree of evidence sufficient to prove the existence of Aboriginal title to a large tract of land a First Nation claimed belonged to them.

indicators and verifiers for common FSC principles and criteria. The generic [FSC international standard](#) devotes Principle 3 to the rights of Indigenous peoples. The criteria under this principle require that Indigenous peoples have control over forest management or that they have provided informed consent to delegate this control. Also required are the preservation of the resources and tenure rights of Indigenous peoples, the identification and protection of sites of significance to Indigenous peoples, and the compensation of Indigenous peoples for the use of their traditional knowledge for forest use and management. In addition to Principle 3, Principle 2 (Tenure and Use Rights and Responsibilities) requires through Criterion 2.2 that local communities that have legal or customary tenure or use rights retain control over the forest operations or delegate this control with free and informed consent. Canada's statement on free, prior, and informed consent includes refraining from a "rigid definition" of the term (Indian and Northern Affairs Canada 2005). Obtaining consent does not give Aboriginal groups a veto over what can be done on the land. The Aboriginal "consent" in the [Delgamuukw](#) case (Canadian Legal Information Institute 1997) is appropriate only in cases of established rights. According to Item 48 of the Supreme Court Case (SCC) of the [Haida Nation](#), consent is based on "...a process of balancing interests, of give and take" (Canadian Legal Information Institute 2004a). In Canada, "local communities" are often considered to be the Aboriginal communities rather than nonaboriginal communities, especially in the Boreal region. In addition, FSC Canada requires all certificate holders to comply with the International Labour Organization (ILO) [Convention 169 on Indigenous and Tribal Peoples](#) (ILO 1989; not currently ratified by Canada). However, the [Canadian FSC certification standards](#) are not intended to switch the responsibility of consulting and accommodating from the government to the forest tenure holders. Although not all four FSC standards include the word "consult" in their requirements (the draft FSC Great Lakes–St. Lawrence standard does not mention consultation in connection with Principle 3), the nature of the FSC indicators requires communication and agreements between tenure holders and relevant Aboriginal groups. Although not a mandatory requirement, written agreements are considered most appropriate by FSC and are strongly encouraged (FSC Canada 2004–2007).

Canadian Standards Association

The [Canadian Standards Association Z809-2002](#) follows the Canadian Council of Forest Ministers' (CCFM) application of Criteria and Indicators through Criteria and Elements. Despite pressure from Aboriginal groups such as the National Aboriginal Forestry Association (NAFA), there is no separate criterion dealing with Aboriginal people (Sherry et al. 2005). Under Criterion 6 (Accepting Society's Responsibility for Sustainable Development), two elements specifically deal with Aboriginal issues, i.e., recognition and respect for treaty rights, and respect for Aboriginal knowledge, values, and uses. Two other elements within the same criterion can also pertain to First Nations: public participation, and information sharing during decision making on forest management. The CSA standard requires demonstration that Aboriginal and treaty rights have been identified and respected (Section 7.3.4.). The requirements of Section 5.2 (c–d) also demand documented evidence that efforts were made to contact Aboriginal forest users and communities affected by or interested in forest management and to encourage them to become involved in identifying and addressing SFM values. Section 5.2 (e) further requires recognition of Aboriginal and treaty rights and consent that Aboriginal participation in the public participation process will not prejudice those rights.

Sustainable Forestry Initiative

An important requirement of both CSA and [SFI standards](#) in the context of Aboriginal issues is compliance with all relevant legal and regulatory requirements. By having this requirement, the SFI is able to ensure that certified companies keep up with the most recent law, although the complexities associated with continuously changing laws create difficulties for both those being certified and for the auditors conducting the certifications. A further complexity is that a decision taken by a lower court can be appealed at a higher level, and so even once decisions are made in court, they may not be permanent. An exception is a decision of the Supreme Court of Canada, as shown by Weyerhaeuser's successful appeal against the Council of the Haida Nation (Canadian Legal Information Institute 2004a), in which the duty to consult was placed upon the Crown, and not upon the industry license holder. In the SFI standard,

compliance with all relevant legislative requirements is augmented by the requirement that participants that manage forests on public land confer with affected Indigenous peoples (Performance Measure 12.4.). Participants in the standard are required to have a program that involves the development of an understanding and respect for traditional forest-related knowledge, that enables the identification and protection of spiritual, historical, or culturally important sites, and that addresses the sustainable use of nontimber forest products of value to Indigenous peoples. This requirement was introduced in the 2005–2009 standard as part of the continual improvement process undertaken by the standard. The draft SFI 2010–2014 standard includes a specific Performance Measure (18.2), that deals with conferring with affected Indigenous peoples when managing forests on public lands. The indicator corresponding to Performance Measure 18.2 pertains to communication with the affected Indigenous peoples.

Both the SFI and CSA have obtained endorsement by the [Programme for Endorsement of Forest Certification](#) (PEFC). This is supposed to open more markets to products certified by SFI or CSA. Regarding the additional requirements that such endorsement involves, the PEFC requires adherence to several “core” ILO Conventions. However, none of those mention Aboriginal issues. International Labour Organization Conventions dealing with Aboriginal peoples (Convention 111 on Indigenous and Tribal Populations and Convention 169 on Indigenous and Tribal Peoples) are not included into the PEFC list, thus limiting the potential effects of PEFC forest certification on Aboriginal peoples.

RESPONSES TO THE STANDARDS FROM ABORIGINAL GROUPS

Given the differences among standards in addressing Aboriginal matters, it is not surprising to find that the views of Aboriginal groups about the standards also vary. For example, NAFA withdrew from participating in the CSA standard review in 2002 because of the lack of a separate Aboriginal criterion in the revised standard (NAFA 1997, Smith 2004). There is a diversity of views on forest certification, and several obstacles that prevent greater commitment to forest certification by Aboriginal communities can be identified. Similarly, a number of potential benefits that

certification could bring to Aboriginal groups can be identified.

Forest certification applies to Aboriginal people in two ways: (1) certification of Aboriginal forest operations and reserve land management, and (2) the certification process for forest industry companies that have Crown tenures in traditional territories, and the impact of this on Aboriginal communities. We discuss these two aspects separately. Chain of custody certification of Aboriginal-owned forest product companies represents another way of adopting certification and is a subset of the former. However, no public data are available about the use of this type of certification by such companies in Canada.

Obstacles Preventing Greater Aboriginal Commitment to Forest Certification

Many of the concerns raised by First Nations arise from a failure of some of the certification standards to treat Aboriginal peoples as a special stakeholder (Collier et al. 2002, Stevenson and Webb 2003, Smith 2004). Even the term “stakeholder” is considered inappropriate by many Aboriginal groups, as it equates the traditional owners of a territory with other groups, such as licensees or other newcomers. The FSC standards single out Indigenous peoples and emphasize their well-being, whereas other standards do not have the same requirements related specifically to Aboriginal communities. Aboriginal views on forestry and forest management also interfere with forest certification. The terminology associated with forest certification may itself be a major barrier for those Aboriginal groups opposed to the term “forest management,” as Indigenous peoples view their management as relationships, where humans are another “relation,” and an integral part of the system (Parsons and Prest 2003, Stevenson and Webb 2003, Natcher et al. 2005, Sherry et al. 2005, Stevenson 2006, Wyatt 2008). In contrast, certification standards require that a specific management area should be defined in the management plans. The ecocentricity of traditional ecological knowledge, and a worldview that focuses on stewardship and connections in time and in space, present obstacles for the greater acceptance of westernized terms and instruments such as forest certification.

The methods of development and data collection for CSA indicators have also represented a dividing

point. Traditional ecological knowledge used by Aboriginal communities cannot be easily translated into the technical indicators developed by western science, as required by the CSA (Karjala et al. 2004, Smith 2004, Sherry et al. 2005, Adam and Kneeshaw 2008, Parrotta and Agnoletti 2007, Cheveau et al. 2008). The failure to identify and incorporate traditional knowledge into a system based on western science is a common problem, and reflects the failure of western scientists to acknowledge that other knowledge systems exist (see, for example, Cajete 1999, Stevenson 2006). Although there have been problems associated with the incorporation of some of the indicators that have already been developed, this remains an active area of research, and a number of potential indicators have been developed in different parts of the world (Sherry et al. 2005). Many of these can be found in a continuously updated public resource known as the [SFM Indicator Knowledge Base](#).

The comparison of international or Canadian Council of Forest Ministers' (CCFM) Criteria and Indicators ("C&I") of Sustainable Forest Management with those developed by the Aboriginal community has been studied in detail (Natcher and Hickey 2002, Stevenson and Webb 2003, Karjala et al. 2004, Smith 2004, Mater 2005, Sherry et al. 2005). Much doubt has been expressed by the Canadian Aboriginal community about the effectiveness of data collection and information interpretation for CCFM and international C&I (Karjala et al. 2004, Smith 2004, Wyatt 2008). However, not all Aboriginal groups view adoption of the C&I as an intrusion over their traditional stewardship. In addition to the Canadian Aboriginal groups holding forest certification and adhering to the C&I in the standards (e.g., [Mistik Management Ltd.](#), or [Iissak Forest Resources Ltd.](#)), international examples of the uptake of C&I through adherence to FSC forest certification by Indigenous communities include three forest management certificates issued to tribal companies in the U.S. (Menominee Tribal Enterprises, Confederated Tribe of the Warm Springs Reservation, and Hoopa Valley Tribal Council), the Lake Taupo Forest Trust in New Zealand, and the Kayapó of the Bau Indigenous Territory in Brazil. Although not all Indigenous groups have maintained certification once they have obtained it (e.g., the White Mountain Apache Tribe in the U.S. was FSC-certified in 2004 but no longer holds a certificate, and the Tsleil-Waututh Nation in British Columbia dropped their FSC certification in 2009), some Indigenous groups do accept and adopt external C&I.

Collier et al. (2002) also suggest that the conflict among existing legal frameworks and certification requirements may interfere with the adoption of forest certification, especially when the conflict pertains to the recognition of Aboriginal rights and title. This is a disadvantage of the highly prescriptive approach adopted by the FSC standards, and the reason why the SFI standard places emphasis on legal compliance. However, Collier et al. (2002) do emphasize that FSC Principle 3 takes the participants beyond minimum legal requirements, and this fact should not preclude adherence to certification. A much more serious obstacle that Aboriginal peoples connect with certification of their operations on reserve land is its perceived prohibitive cost and the associated increase in both the direct and indirect costs of management (Collier et al. 2002, Mater 2005, Wyatt 2008). Despite the achievements of federal program (e.g., the [First Nations Forestry Program](#)) and other partnerships (Wilson and Graham 2005, Wyatt 2008) that have been created to assist Aboriginal peoples to practise forestry, the deficit between the available resources and the capacity of the Indigenous enterprises and communities remains apparent (Collier et al. 2002, Molnar 2004, Sherry et al. 2005, Wilson and Graham 2005). Part of this is because most attempts to increase Aboriginal forestry capacity have concentrated on increasing the capacity of Aboriginal peoples to practise industrial forestry, without considering whether current industrial forestry practices are an appropriate basis to build sustainable Aboriginal communities (Stevenson and Perrault 2008).

Potential Benefits from Forest Certification

The improvement of community and Aboriginal relations has been named as one of the reasons why the forest industry chooses to certify management operations (Takahashi et al. 2003, van Kooten et al. 2005). A few sources have discussed the potential of forest certification for Aboriginal communities. Adam and Kneeshaw (2008) compare FSC-Boreal requirements with land-stewardship indicators developed by Aboriginal groups and conclude that although some overlap exists, there are also omissions: Aboriginal indicators covered all topics identified by the FSC, but a few specific Aboriginal indicators addressed ongoing access to the resource, aesthetics, and respect for Aboriginal role in resource stewardship.

The federal First Nations Forestry Program investigated awareness and adoption of certification among Aboriginal groups, and found little interest in certification (First Nations Forestry Program 2006). A study addressing certification and Aboriginal expectations in Ontario did not find much difference between opinions of certified and noncertified respondents (Kant and Brubacher 2008). Several sources considered the FSC standards to be the most appropriate (NAFA 1996, Ozinga 2001, Collier et al. 2002, Jensens et al. 2002, Molnar 2003, Parsons and Prest 2003, Ozinga 2004, Wilson and Graham 2005). This preference is often attributed to the explicit references to First Nations in the FSC standards, and also the notion that the FSC generic standard was originally conceived for small-scale forest operations in tropical regions. Both the SFI and the CSA standards are designed primarily for large-scale industrial forestry operations and, therefore, are less appropriate for the type of operation run by most First Nations. However, it needs to be noted that few recent sources specifically discuss certification pertaining to Aboriginal people, and forest certification standards undergo continual changes. The advantages that certification of both operations on reserve land and industrial licensees operating in the traditional territories of Aboriginal peoples bring to Aboriginal communities include increased control over forest management and involvement in decision making, greater protection of nontimber forest products, potential for economic benefit and capacity building for Aboriginal communities, and an improved relationship with the forest industry (NAFA 1996, Collier et al. 2002). The advantage of chain of custody certification of Aboriginal forest products operations relate primarily to the ability to market forest products from certified land areas.

Smith (2004) indicates that forest-certification requirements supplement the governmental requirements in addressing Aboriginal rights, and that this is particularly important where there is ongoing uncertainty, e.g., in British Columbia, where treaties have yet to be established with most First Nations (Molnar 2003, Tollefson 2003, Molnar 2004).

Forest Stewardship Council Principle 3 requires that forest companies obtain Aboriginal peoples' consent over the management of land that is relevant to Aboriginal peoples. The FSC process takes the negotiations beyond the regulatory realm and provides greater opportunities for Aboriginal

involvement in forest management, i.e., it requires not only consultation, but also their informed consent. The FSC-BC standard also assumes the First Nations' rights and title over land, without the litigation that has so far been a method of defining the rights and title in the absence of existing treaties (Tollefson 2003). A British Columbia Government initiative has been developed to address Aboriginal rights and title without litigation (Office of the Premier and First Nations Leadership Council 2009), but at time of writing, the proposed legislation was still under review.

Obstacles for forest certification and potential benefits from certification for Aboriginal groups are summarized in Table 2, as they apply to certifying Aboriginal operations on reserve land or to certification of tenure holders operating in the Aboriginal traditional territories.

APPLICABILITY AND SCOPE OF FOREST CERTIFICATION

Here, we briefly describe existing certified Aboriginal operations across Canada, and discuss potential benefits arising from forest certification for companies operating in traditional territory. The discussion follows the two aspects where forest certification applies to Aboriginal people: the certification of Aboriginal forest operations and reserve land management, and the certification process of non Aboriginal companies operating in Aboriginal traditional territories.

Certification of Aboriginal Forestry Enterprises

Wilson and Graham (2005) report 1,493 Aboriginal business operations related to forestry in 2002 and over 7 million m³ of timber allocated to First Nations through Crown tenures. In recent years, this figure has been increasing (Hickey and Nelson 2005). For example, in British Columbia, 7.3 million m³ had been awarded to First Nations through nonrenewable licences by 2006, with an additional possibility of access to 3.3 million m³ annually (Parfitt 2007). Several recent agreements signed in British Columbia have given First Nations control over larger tracts of forest land than the previous corresponding reserves, in some cases including harvesting and forest protection (British Columbia

Table 2. Potential benefits from, and obstacles to, Aboriginal commitment to forest certification.

		Where applicable
Benefits		
Increased control over forest management and involvement in decision making (Collier et al. 2002, National Aboriginal Forestry Association 1996)		Traditional territory
Greater protection of non-timber forest products (Collier et al. 2002)		Traditional territory
Potential for economic benefit and capacity building for Aboriginal communities (Collier et al. 2002, Yukon Conservation Society 2003)	Reserve land	Traditional territory
Improved relationship with the forest industry (Collier et al. 2002, National Aboriginal Forestry Association 1996)		Traditional territory
Forest certification supplements governmental requirements when there is no regulation on Aboriginal rights (National Aboriginal Forestry Association 1996, Tollefson 2003, Smith 2004).		Traditional territory
Obstacles		
The approach to Aboriginal peoples as a special stakeholder differs by standard (Collier et al. 2002, Stevenson and Webb 2003, Smith 2004).		Traditional territory
Difficult to equalize terminology acceptable to both certification entities and Aboriginal groups (Parsons and Prest 2003, Stevenson and Webb 2003, Natcher et al. 2005, Wyatt 2008).	Reserve land	Traditional territory
Differences between traditional ecological knowledge and SFM indicators in content and data collection (Karjala et al. 2004, Smith 2004, Sherry et al. 2005).	Reserve land	Traditional territory
Possible interference of some certification standards with legal processes establishing Aboriginal rights and title (Collier et al. 2002, Parsons and Prest 2003).	Reserve land	Traditional territory
Prohibitive cost increase in both direct and indirect cost of management (Collier et al. 2002, Mater 2005, Wyatt 2008).	Reserve land	

Treaty Commission 2009b). However, very few examples of certification relate to First Nations' forestry enterprises in Canada. Details of the current examples of certified Aboriginal forestry are shown in Table 3. The International Organization for Standardization environmental management standard (ISO 14001) does not contain any requirements related to Aboriginal communities; however, it is sometimes used a precursor for one or more of the other certification standards, and is included in the

discussion of certified companies (First Nations Forestry Program 2006).

A study undertaken in the U.S. in 2002 analyzed the views of 30 U.S. tribes on certification (Mater 2005). The study showed that 50% were willing to pursue FSC certification. Although none were ready to undergo the full SFI certification, 24% responded that they would choose SFI if given a choice between SFI and FSC. Although valid at the time

Table 3. Currently certified Aboriginal forest companies.

Standard	Year of certification	Area under certificate	Type of tenure	Details
Iisaak Forest Resources, BC				
FSC-International Recertified to FSC-BC [†]	2001, latest recertification in 2007 ^{‡,§}	87,664 ha; after 2007 76,794 ha ^{‡,§}	Mix of area-based tenures. After recertification in 2007, short-term tenures excluded from certificate. ^{‡,§}	Originally, 51% of Iisaak Forest Resources were in a joint venture with McMillan Bloedel Ltd., which was later purchased by Weyerhaeuser. Full First Nations' ownership from 2005. Harvest in 2000 was 22,197 m ³ . Financial stability was a major difficulty associated with the 2007 recertification. ^{‡,§}
Pictou Landing First Nation, NS				
FSC-Maritimes	2000, latest recertification in 2006 ^{!¶}	384.5 ha	Community forest (private and reserve land)	SLIMF. [#] No harvest in 2004–2007. Restoration of Acadian forest as main objective. ^{!¶}
Eel Ground First Nation, NB				
FSC-Maritimes	2005	2,853 ha	Reserve land	SLIMF [#] , harvesting <5,000 m ³ per yr. ^{††}
Mistik Management Ltd., SK				
ISO 14001 CSA ^{§§} FSC-Boreal ^{‡‡}	2004 2005 2007	1.8 million ha	Forest Management Area—public land, privately managed	50% owned by NorSask (Meadow Lake Tribal Council); 50% by Meadow Lake Mechanical Pulp Inc. Annual harvest is 445,000 m ³ of softwood and 805,000 m ³ of hardwood. ^{§§}
Services Forestiers Opitciwan, QC				
ISO 14001	2005	N/A	Mix of private and public land.	Supplies wood mainly to Scierie Opitciwan sawmill, which is a joint venture of Atikamekw Band of Opitciwan (Atikamekw Council of Obedjiwan) and Abitibi-Consolidated Ltd. Annual wood harvest is 120,000 m ³ . ^{¶¶}

of the survey, these findings may no longer be applicable now that the American Tree Farm System has achieved endorsement by the international Programme for the Endorsement of Forest Certification. It is much more applicable for smaller operations, as many Aboriginal enterprises tend to be.

A more recent study of First Nations communities in Canada revealed that Aboriginal forestry personnel are generally aware of forest certification, but consider the standards and their implementation resource-intensive (First Nations Forestry Program 2006). A few Aboriginal groups have considered FSC certification for their reserve lands as a possibility for recognizing their forest stewardship and to gain market access (e.g., Tobique First Nation 2002, Yukon Conservation Society 2003), but have not yet obtained it.

The cost of certification has been an issue for almost all certified holdings in Canada. Until now, the financial support or other resources for certification initiatives have been obtained from environmental groups, corporate partnerships, or governmental organizations. For example, Iisaak Forest Resources used to be a joint venture with MacMillan Bloedel that was later purchased by Weyerhaeuser with all MacMillan Bloedel commitments honoured before Weyerhaeuser withdrew from the region (Coady 2002). Eel Ground First Nation received funding from the federal First Nations Forestry Program (2009), and Services Forestiers Opitciwan received resources from the federal Indian and Northern Affairs Canada (2004) and First Nations Forestry Program (2009). The use of federal funding to support what many would consider to be a cost of forest management is interesting, and could be interpreted as a form of domestic subsidy to specific enterprises within the forest sector, a potential issue if their products are exported to the U.S. (Zhang 2007). However, the U.S. also uses federal resources for promoting forest certification. Molnar (2004) reported the support for tribal certification from the Department of the Interior and U.S. Forest Service as a “part of the government’s ‘trust’ responsibility to these nations.” The U.S. Bureau of Indian Affairs (BIA) is expected to support marketing of third-party certified forest products from Aboriginal sources (National Congress of American Indians 2002).

Some First Nations have received aid from private sources. For example, the Tsleil-Waututh First

Nation (Inlailawatash Holdings Ltd.) obtained technical support from the charitable nonprofit organization Ecotrust Canada. Ecotrust Canada was also hired as a general manager for Iisaak Forest Resources (now 100% Aboriginal-owned) and has provided the resources to employ Triumph Timber for operational management of the land and for maintaining the FSC certification (SmartWood Program 2005, 2007*b,c*). A particularly interesting dynamic is evident in these cases. Forestry economics traditionally is based on the economic yield provided by timber harvests. However, it is evident that some First Nations are successfully supplementing this income through payments from governments and environmental organizations. Should such payments be viewed as subsidies, or the successful application of payments for environmental services?

?

Economies of scale is one reason why so few Aboriginal companies adopt the major standards (Fischer et al. 2005). Although the majority of Aboriginal tenures fall in the category of small tenures (NAFA 2007), processes exist to assist institutions with small tenures to achieve certification. Group certification offered by the FSC may be an option for operations with small and/or overlapping tenures. Another FSC option, the [Small and Low Intensity Managed Forests \(SLIMF\)](#) program, is offered to participants with forest tenures where timber harvesting does not happen in the industrial manner. Three out of four certified Aboriginal operations in Canada are certified to the FSC SLIMF program (Forest Stewardship Council 2002).

Several possibilities exist for woodlot-type tenures that, in the case of Aboriginal groups, apply to reserve land. There is the [American Tree Farm System \(ATFS\)](#) that is endorsed by the PEFC, or the newly-adopted [CSA Z804-08 standard](#) for woodlots and small-area forests.

Certification Process of Companies Operating in Traditional Territory

Almost all certified non Aboriginal forest companies in Canada conduct forest management in the traditional territories of Aboriginal peoples. Forest certification standards require consultation with, or consultation with and consent of, Aboriginal peoples affected by forest management.

Many of the potential benefits described above can be related to cooperation with the companies working in traditional territories. Although the forest industry is often viewed as an opponent of Aboriginal groups in land-use decision making, it has been a major employer for small forest-dependent communities, with over 300 communities falling into this category (Wilson and Graham 2005). These include many Aboriginal communities. Forest certification has served as a vehicle for dialog between Aboriginal peoples and the forest industry, whereby values and motives are communicated bilaterally (Collier et al. 2002, Wilson and Graham 2005). Certification has raised industry awareness of current Aboriginal issues. An improved relationship with the forest industry may lead to greater understanding and, therefore, greater respect for Aboriginal values. The analysis of forest-certification audit conditions indicated a high number of required changes in relation to Aboriginal relations (Masters et al. 2010). However, the audit conditions do not immediately translate into changes in operations: companies can obtain certification with a few years granted to fix all the audit conditions.

Recent research indicated that Aboriginal people perceived some positive effects of forest certification through improved communication, employment opportunities, and protection of relevant environmental features (Tikina et al. 2009). Kant and Brubacher (2008) also found that the level of expectation from participatory decision making was higher for Aboriginal groups with certified forests in their territory. However, the level of awareness of forest certification is not high (Kant and Brubacher 2008, Krishnaswamy et al. 2009) and the awareness is limited to forestry program staff members (First Nations Forestry Program 2006). Given that all certified companies in Canada operate in the traditional territories of different Aboriginal groups, this lack of awareness shows that forest certification only marginally influences the livelihoods of Aboriginal people.

CONCLUSION

Current law related to Aboriginal rights and title presents difficulties for certified forest companies: fulfilling forest-certification requirements to comply with the applicable law, the companies seek legal compliance, but the law is constantly changing with new court decisions or proposed legislation.

Yet, forest certification can bring a number of benefits to Aboriginal peoples. Improved communication and greater awareness of Aboriginal concerns can spring from certification processes in traditional territories. The benefits resulting from certifying an Aboriginal forest holding include the possibility of recognition of Aboriginal forest stewardship and, when combined with appropriate marketing and/or chain of custody certification, the possibility of gaining access to niche markets for timber products derived from Aboriginal lands.

The limited number of certified Aboriginal companies in Canada implies that obstacles to adoption of certification among Aboriginal entities prevail. In addition to the perceived high costs of certification that preclude the participation of small Aboriginal operations, significant resources are required to change the current situation. For many Aboriginal forestry operations, external financial support will play an important role in obtaining certification. Among other obstacles, there are differences in worldviews between western science and the traditional Aboriginal relationship with nature, and difficulties in relating traditional ecological knowledge to the criteria and indicators used by certification standards.

Future research should address these questions: "Should Aboriginal people adopt forest certification?" and "If yes, what steps can be made to stimulate adopting certification by Aboriginal groups?" Forest certification has not been a panacea for resolving issues around forest management. It has been shown that adoption of forest certification would require significant resources and education (Archer et al. 2005, Krishnaswamy et al. 2009). Forest certification must clearly become a beneficial proposition, in terms of monetary and nonmonetary benefits, before Aboriginal groups adopt it. Acknowledging Aboriginal sourcing of wood products and obtaining a price premium for them could be a possible way to change the situation. In this case, a standard should include provisions for emphasizing the Aboriginal wood origin. Or, a separate Aboriginal certification standard, different from the major certification systems currently used in Canada, could play a similar role.

In regard to forestry in Aboriginal traditional territories, the following questions present an opportunity for future research: "Is forest certification an effective mechanism to account for

Aboriginal values in forest planning and forest management on the traditional territory?” and “How can the effectiveness of forest certification be improved in this regard?” This area of research would start with assessing Aboriginal expectations of their involvement in forest management over their traditional territory. Examples of the successful resolution of issues between Aboriginal groups and other stakeholders through forest certification would provide insights on effective and ineffective aspects of the system. Although we discovered a limited ability for forest certification to affect Aboriginal livelihoods, the development of forest-certification standards and systems does provide opportunities for greater involvement of Aboriginal people in forest certification.
